

Movie Booker - Project Documentation

Overview

Movie Booker is Django a web application for booking movie tickets. Users can browse movies, select screening times, and reserve seats in a specific theater room. The application offers a simple and intuitive interface for managing movies, screenings, and bookings.

Technologies used

- **Backend:** Django (Python)
- **Database:** SQLite
- **Frontend:** HTML, CSS, JavaScript, Bootstrap
- **Python version:** 3.13.2

Project Structure

The Django Movie Booker project is organized into several apps and folders, each responsible for specific functionality:

- **movies app:** Responsible for managing movies, including details such as title, duration, and description.
- **cinema app:** Handles the management of rooms (theater halls), screenings (scheduled movie showings), and tickets (seat bookings).
- **authentication app:** Manages user authentication and related functionality, leveraging Django's built-in user system.
- **common folder:** Contains shared code and utilities that can be reused across different apps within the project to promote modularity and reduce duplication.
- **static folder:** Includes static assets such as background images that are used in various templates throughout the application to maintain a consistent look and feel.

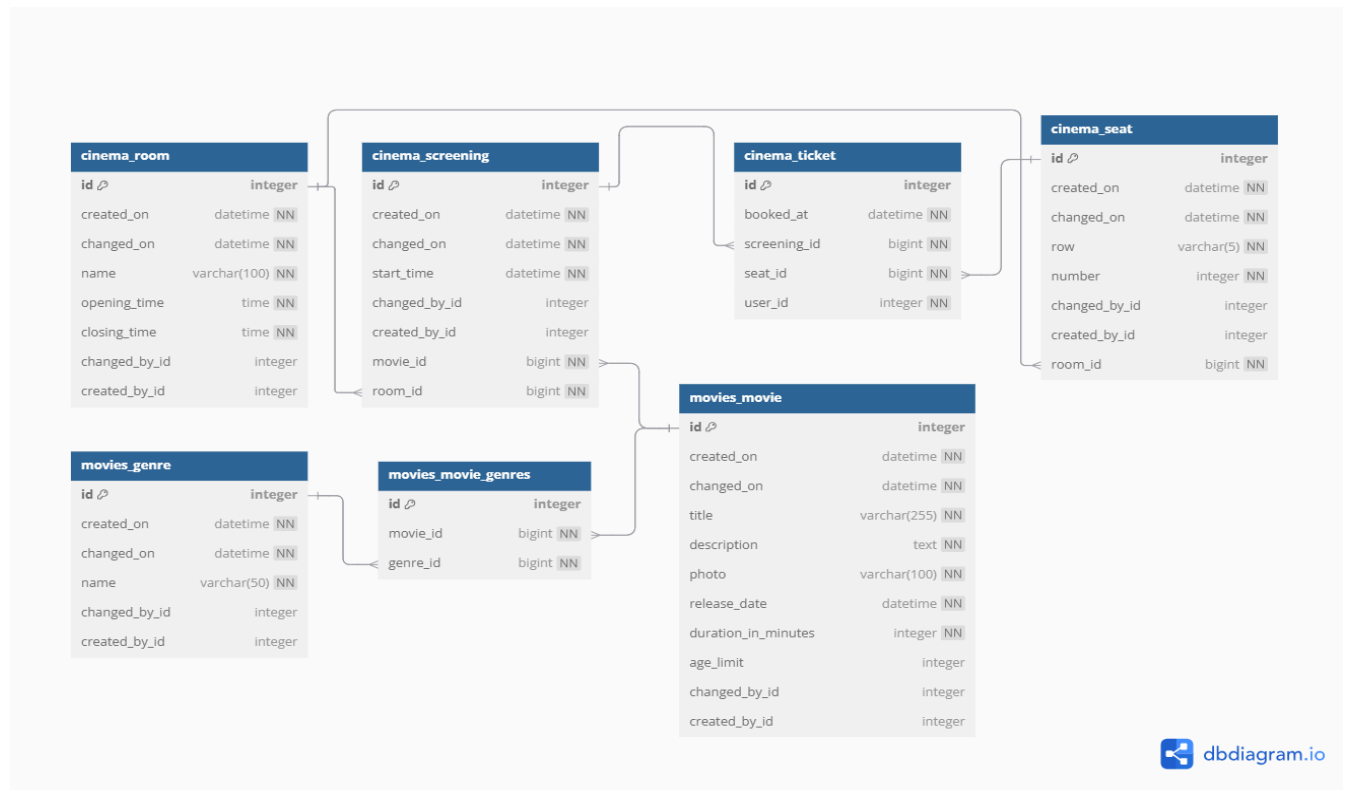

Models

The core of the Django Movie Booker application is built around a set of models that represent the main entities in the system: movies, rooms, screenings, and bookings. These models define

the structure of the data and the relationships between different parts of the app. Each model encapsulates the key attributes and behaviors of its corresponding entity.

User management is handled using Django's built-in User model, taking advantage of its robust authentication framework and eliminating the need to create a custom user model.

Below are the main models designed by me:

Functionalities by user role

Admin User

- Manage movies: add and edit.
- Manage rooms: create and edit.
- Schedule screenings: assign movies to rooms with specific dates and times.
- Delete screenings if there are no tickets booked yet.
- View bookings.

Client User

- Register and log in using the authentication system.

- Browse movies and screenings.
- View available seats for screenings.
- Book tickets where they can select available seats.
- View own tickets.

Anonymous User (Guest)

- Browse movies and screenings.
- View general information about movies and showtimes.
- Prompted to log in or register to book tickets.
